Hello David,

Say, I tried to run your code and it might need updating as it fall over on present day SUMO. I'm happy to do that but would you be ok if I put it up on github? I'm happy to stand in as maintainer.
The source code says it's in the public domain but I thought courtesy demands I ask.

Yes, please do take over, I'd just appreciate a citation way at the bottom somewhere.

After I shipped you the file, I did some more digging about how this came to disappear from the web and found the following.

The [page that was at NIST](#) said that the software had been handed off to Teknowledge Corporation.
[Teknowledge](#) was distributing a file named sumo2loom_b81.zip. I don't know what they may have changed versus my "baseline 8" which was the last version that I touched. They still have a DNS record but I get no response. At any rate, the version that I sent you remains public domain.

The tarball that I sent contains some version of the Dstr class. A later version than can be built as a separate shared library can be found [here](#).

Best wishes, DWF
